email

## 1 Introduction

1. Introduction to explain our interest in relational reasoning on QA task.
2. What are the current methods in text-based QA task.
3. Replication of the RN network with slight modifications: using universal sentence encoder (USE) instead of LSTMs to do sentence embedding and (if have time) adding attention to the network, since the relation obtained by  $g_{\theta}(o_i, o_j, q)$  are weighted equally before feeding it into the  $f_{\phi}$ .

Deep learning has made it possible to do classification of objects in images and translation of languages, often with incredible accuracy. This is achieved due to the ability of neural networks to pick out important patterns that are inconceivable to the human eye, from large quantities of labeled data. However, just being able to learn patterns is not sufficient as it is not the only ability associated to intelligence; reasoning is another essential ability [1] that separates humans from machines. Hence, in recent years there is much work on reasoning related research, like visual reasoning [3, 4] where the machine is able to give an answer given an image and a visual question about the image, and text-based question answering [4] where the machine is able to answer a question based on the earlier sentences given to it.

### (impact of embedding and model performances)

For this project, we focus on the text-based question answering task using relation network (RN) [4] on the bAbI dataset [5]. RNs are networks that are designed based on relational reasoning, where its capacity to compute relations is baked into the architecture without having the neural network to learn it.

(short explanation on what is RN - one line)

### (using both lstm and use)

Here, we use both LSTMs to produce objects, which are the basic units that are passed through the RN, we used the universal sentence encoder (USE) [2] model to embed the sentences into the objects that are to be fed into the RN. In this project, we focus on task 2 of the bAbI task as it is one of the most commonly task failed, which we feel is due to its task design of requiring two supporting facts to arrive at the answer.

## 2 Task

1. Brief introduction to bAbI dataset and focus on task 2.

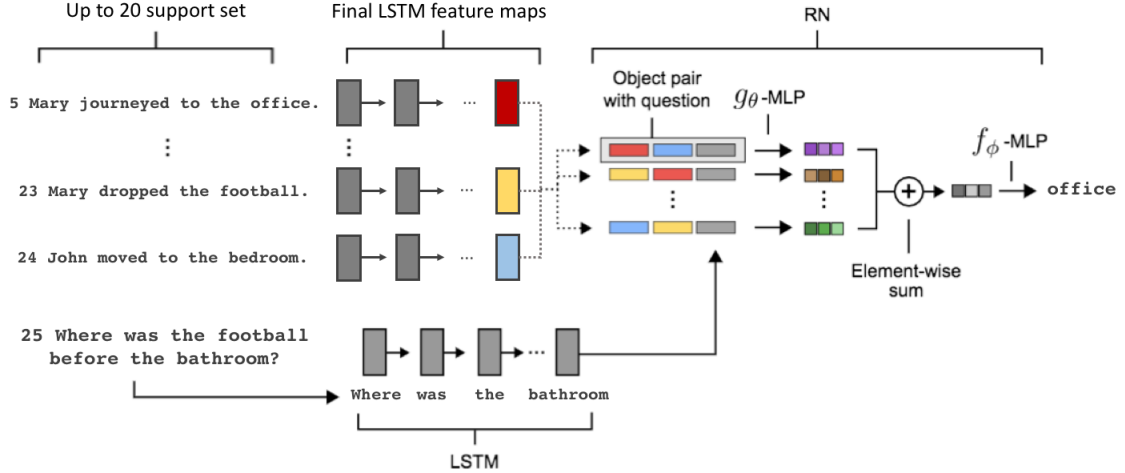

Figure 1: Text based QA architecture. Contexts and questions are processed with an LSTM to produce a set of context and question embedding. Objects, colored yellow, red, and blue, are constructed using LSTMs or USE. The RN considers relations across all pairs of objects, conditioned on the question embedding, and integrates all these relations to answer the question.

## 2.1 bAbI

The bAbI dataset is a pure text-based question answering (QA) dataset that contains a total of 20 tasks. Each task corresponds to a particular type of reasoning, such as deduction, induction and counting. Every questions is associated with a set of supporting facts, which provides the context for the question being asked. An example “Sandra picked up the football” and “Sandra went to the office” support the question “Where is the football?”, which we humans can arrive at an easy at the answer “office”. A task is considered to be successfully passed if it attains an accuracy of 95% or higher.

## 2.2 Two Supporting Fact Task

The task 2 of bAbI...

## 3 Model

1. Overview of the original RN model, comment on the strength and weaknesses
2. Modifications to the RN model that will help improve the accuracy of the task. Motivations for the modifications.
3. (Optional) A paragraph on USE?
4. How long we take to train our model and the train/test accuracy, loss values etc. Use original RN paper as a guideline of what numbers to show.

### 3.1 Relation Network

RNs take in objects as its input and do not explicitly operate on natural language

In their simplest form RNs operate on objects, and hence do not explicitly operate on images or natural language. A central contribution of this work is to demonstrate the flexibility with which relatively unstructured inputs, such as CNN or LSTM embeddings, can be considered as a set of objects for an RN. Although the RN expects object representations as input, the semantics of what an object is need not be specified. Our results below demonstrate that the learning process induces upstream processing, comprised of conventional neural network modules, to produce a set of useful “objects” from distributed representations.

In the original RN model by [4] for the bAbI task,

57 In the model used by [4], up to a maximum of 20 sentences in the support set was processed through  
58 a 32 unit LSTM to produce an object. The  $g_\theta$  is a four-layer MLP which contains 256 units per layer,  
59 and takes as input all possible pairings of of the sentences in the support set, concatenated with the

## 60 3.2 Embeddings

61 Short paragraph on embeddings, bert, Elmo, glove, etc.

### 62 3.2.1 LSTM

63 hashing on the word level, the lstm to obtain an embedding on the sentence level.

### 64 3.2.2 Universal Sentence Encoder

65 paper, tensorflow blog

## 66 4 Results

67 Example of results: Our model succeeded on 18/20 tasks. Notably, it succeeded on the basic induction  
68 task (2.1% total error), which proved difficult for the Sparse DNC (54%), DNC (55.1%), and EntNet  
69 (52.1%). Also, our model did not catastrophically fail in any of the tasks: for the 2 tasks that it  
70 failed (the “two supporting facts”, and “three supporting facts” tasks), it missed the 95% threshold  
71 by 3.1% and 11.5%, respectively. We also note that the model we evaluated was chosen based on  
72 overall performance on a withheld validation set, using a single seed. That is, we did not run multiple  
73 replicas with the best hyperparameter settings (as was done in other models, such as the Sparse DNC,  
74 which demonstrated performance fluctuations with a standard deviation of more than  $\pm 3$  tasks passed  
75 for the best choice of hyperparameters). 5.5

## 94 6 Submission of papers to NIPS 2018

95 NIPS requires electronic submissions. The electronic submission site is

96 <https://cmt.research.microsoft.com/NIPS2018/>

97 Please read the instructions below carefully and follow them faithfully.

### 98 6.1 Style

99 Papers to be submitted to NIPS 2018 must be prepared according to the instructions presented here.  
100 Papers may only be up to eight pages long, including figures. Additional pages *containing only*  
101 *acknowledgments and/or cited references* are allowed. Papers that exceed eight pages of content  
102 (ignoring references) will not be reviewed, or in any other way considered for presentation at the  
103 conference.

104 The margins in 2018 are the same as since 2007, which allow for  $\sim 15\%$  more words in the paper  
105 compared to earlier years.

106 Authors are required to use the NIPS L<sup>A</sup>T<sub>E</sub>X style files obtainable at the NIPS website as indicated  
107 below. Please make sure you use the current files and not previous versions. Tweaking the style files  
108 may be grounds for rejection.

### 109 6.2 Retrieval of style files

110 The style files for NIPS and other conference information are available on the World Wide Web at

111 <http://www.nips.cc/>

112 The file `nips_2018.pdf` contains these instructions and illustrates the various formatting require-  
113 ments your NIPS paper must satisfy.

114 The only supported style file for NIPS 2018 is `nips_2018.sty`, rewritten for L<sup>A</sup>T<sub>E</sub>X 2<sub>ε</sub>. **Previous**  
115 **style files for L<sup>A</sup>T<sub>E</sub>X 2.09, Microsoft Word, and RTF are no longer supported!**

116 The L<sup>A</sup>T<sub>E</sub>X style file contains three optional arguments: `final`, which creates a camera-ready copy,  
117 `preprint`, which creates a preprint for submission to, e.g., arXiv, and `nonatbib`, which will not  
118 load the `natbib` package for you in case of package clash.

119 **New preprint option for 2018** If you wish to post a preprint of your work online, e.g., on arXiv,  
120 using the NIPS style, please use the `preprint` option. This will create a nonanonymized version of  
121 your work with the text “Preprint. Work in progress.” in the footer. This version may be distributed  
122 as you see fit. Please **do not** use the `final` option, which should **only** be used for papers accepted to  
123 NIPS.

124 At submission time, please omit the `final` and `preprint` options. This will anonymize your  
125 submission and add line numbers to aid review. Please *do not* refer to these line numbers in your  
126 paper as they will be removed during generation of camera-ready copies.

127 The file `nips_2018.tex` may be used as a “shell” for writing your paper. All you have to do is  
128 replace the author, title, abstract, and text of the paper with your own.

129 The formatting instructions contained in these style files are summarized in Sections 7, 8, and 9  
130 below.

## 131 7 General formatting instructions

132 The text must be confined within a rectangle 5.5 inches (33 picas) wide and 9 inches (54 picas) long.  
133 The left margin is 1.5 inch (9 picas). Use 10 point type with a vertical spacing (leading) of 11 points.  
134 Times New Roman is the preferred typeface throughout, and will be selected for you by default.  
135 Paragraphs are separated by 1/2 line space (5.5 points), with no indentation.

136 The paper title should be 17 point, initial caps/lower case, bold, centered between two horizontal  
137 rules. The top rule should be 4 points thick and the bottom rule should be 1 point thick. Allow  $\frac{1}{4}$  inch  
138 space above and below the title to rules. All pages should start at 1 inch (6 picas) from the top of the  
139 page.

140 For the final version, authors' names are set in boldface, and each name is centered above the  
141 corresponding address. The lead author's name is to be listed first (left-most), and the co-authors'  
142 names (if different address) are set to follow. If there is only one co-author, list both author and  
143 co-author side by side.

144 Please pay special attention to the instructions in Section 9 regarding figures, tables, acknowledgments,  
145 and references.

## 146 **8 Headings: first level**

147 All headings should be lower case (except for first word and proper nouns), flush left, and bold.

148 First-level headings should be in 12-point type.

### 149 **8.1 Headings: second level**

150 Second-level headings should be in 10-point type.

#### 151 **8.1.1 Headings: third level**

152 Third-level headings should be in 10-point type.

153 **Paragraphs** There is also a `\paragraph` command available, which sets the heading in bold, flush  
154 left, and inline with the text, with the heading followed by 1 em of space.

## 155 **9 Citations, figures, tables, references**

156 These instructions apply to everyone.

### 157 **9.1 Citations within the text**

158 The `natbib` package will be loaded for you by default. Citations may be author/year or numeric, as  
159 long as you maintain internal consistency. As to the format of the references themselves, any style is  
160 acceptable as long as it is used consistently.

161 The documentation for `natbib` may be found at

162 `http://mirrors.ctan.org/macros/latex/contrib/natbib/natnotes.pdf`

163 Of note is the command `\citet`, which produces citations appropriate for use in inline text. For  
164 example,

165 `\citet{hasselmo}` investigated\dots

166 produces

167 Hasselmo, et al. (1995) investigated...

168 If you wish to load the `natbib` package with options, you may add the following before loading the  
169 `nips_2018` package:

170 `\PassOptionsToPackage{options}{natbib}`

171 If `natbib` clashes with another package you load, you can add the optional argument `nonatbib`  
172 when loading the style file:

173 `\usepackage[nonatbib]{nips_2018}`

Figure 2: Sample figure caption.

174 As submission is double blind, refer to your own published work in the third person. That is, use “In  
175 the previous work of Jones et al. [4],” not “In our previous work [4].” If you cite your other papers  
176 that are not widely available (e.g., a journal paper under review), use anonymous author names in the  
177 citation, e.g., an author of the form “A. Anonymous.”

## 178 9.2 Footnotes

179 Footnotes should be used sparingly. If you do require a footnote, indicate footnotes with a number<sup>1</sup>  
180 in the text. Place the footnotes at the bottom of the page on which they appear. Precede the footnote  
181 with a horizontal rule of 2 inches (12 picas).

182 Note that footnotes are properly typeset *after* punctuation marks.<sup>2</sup>

## 183 9.3 Figures

184 All artwork must be neat, clean, and legible. Lines should be dark enough for purposes of reproduction.  
185 The figure number and caption always appear after the figure. Place one line space before the figure  
186 caption and one line space after the figure. The figure caption should be lower case (except for first  
187 word and proper nouns); figures are numbered consecutively.

188 You may use color figures. However, it is best for the figure captions and the paper body to be legible  
189 if the paper is printed in either black/white or in color.

## 190 9.4 Tables

191 All tables must be centered, neat, clean and legible. The table number and title always appear before  
192 the table. See Table 1.

193 Place one line space before the table title, one line space after the table title, and one line space after  
194 the table. The table title must be lower case (except for first word and proper nouns); tables are  
195 numbered consecutively.

196 Note that publication-quality tables *do not contain vertical rules*. We strongly suggest the use of the  
197 booktabs package, which allows for typesetting high-quality, professional tables:

198 `https://www.ctan.org/pkg/booktabs`

199 This package was used to typeset Table 1.

## 200 10 Final instructions

201 Do not change any aspects of the formatting parameters in the style files. In particular, do not modify  
202 the width or length of the rectangle the text should fit into, and do not change font sizes (except  
203 perhaps in the **References** section; see below). Please note that pages should be numbered.

---

<sup>1</sup>Sample of the first footnote.

<sup>2</sup>As in this example.

Table 1: Sample table title

Part		
Name	Description	Size ( $\mu\text{m}$ )
Dendrite	Input terminal	$\sim 100$
Axon	Output terminal	$\sim 10$
Soma	Cell body	up to $10^6$

## 11 Preparing PDF files

Please prepare submission files with paper size “US Letter,” and not, for example, “A4.”

Fonts were the main cause of problems in the past years. Your PDF file must only contain Type 1 or Embedded TrueType fonts. Here are a few instructions to achieve this.

- You should directly generate PDF files using `pdflatex`.
- You can check which fonts a PDF file uses. In Acrobat Reader, select the menu Files>Document Properties>Fonts and select Show All Fonts. You can also use the program `pdf fonts` which comes with `xpdf` and is available out-of-the-box on most Linux machines.
- The IEEE has recommendations for generating PDF files whose fonts are also acceptable for NIPS. Please see <http://www.emfield.org/icuwb2010/downloads/IEEE-PDF-SpecV32.pdf>
- `xfig` “patterned” shapes are implemented with bitmap fonts. Use “solid” shapes instead.
- The `\bbold` package almost always uses bitmap fonts. You should use the equivalent AMS Fonts:

```
\usepackage{amsfonts}
```

followed by, e.g., `\mathbb{R}`, `\mathbb{N}`, or `\mathbb{C}` for  $\mathbb{R}$ ,  $\mathbb{N}$  or  $\mathbb{C}$ . You can also use the following workaround for reals, natural and complex:

```
\newcommand{\RR}{\mathbb{R}} %real numbers
\newcommand{\Nat}{\mathbb{N}} %natural numbers
\newcommand{\CC}{\mathbb{C}} %complex numbers
```

Note that `amsfonts` is automatically loaded by the `amssymb` package.

If your file contains type 3 fonts or non embedded TrueType fonts, we will ask you to fix it.

### 11.1 Margins in L<sup>A</sup>T<sub>E</sub>X

Most of the margin problems come from figures positioned by hand using `\special` or other commands. We suggest using the command `\includegraphics` from the `graphicx` package. Always specify the figure width as a multiple of the line width as in the example below:

```
\usepackage[pdftex]{graphicx} ...
\includegraphics[width=0.8\linewidth]{myfile.pdf}
```

See Section 4.4 in the `graphics` bundle documentation (<http://mirrors.ctan.org/macros/latex/required/graphics/grfguide.pdf>)

A number of width problems arise when L<sup>A</sup>T<sub>E</sub>X cannot properly hyphenate a line. Please give LaTeX hyphenation hints using the `\-` command when necessary.

### Acknowledgments

Use unnumbered third level headings for the acknowledgments. All acknowledgments go at the end of the paper. Do not include acknowledgments in the anonymized submission, only in the final paper.

239 **References**

240 References follow the acknowledgments. Use unnumbered first-level heading for the references. Any  
241 choice of citation style is acceptable as long as you are consistent. It is permissible to reduce the font  
242 size to small (9 point) when listing the references. **Remember that you can use more than eight**  
243 **pages as long as the additional pages contain only cited references.**
