

Lemma 0.1. For $x \in (0, 1)$

$$(1 - x)^{1/x} \leq (e^{-x})^{1/x} = e^{-1}$$

Theorem 0.2. Consider a (λ, μ) -cost minimization game with a positive potential function Φ such that $\Phi(\mathbf{s}) \leq \text{cost}(\mathbf{s})$ for every outcome \mathbf{s} . Let $\mathbf{s}^0, \mathbf{s}^1, \dots, \mathbf{s}^T$ be a sequence generated by MaxGain best response dynamics, \mathbf{s}^* a minimum cost outcome and $1 > \gamma > 0$ is a parameter, Then for all but

$$\frac{k}{\gamma(1 - \mu)} \log \frac{\Phi(\mathbf{s}^0)}{\Phi_{\min}} \quad (1)$$

outcomes \mathbf{s}^t satisfy

$$\text{cost}(\mathbf{s}^t) \leq \left(\frac{\lambda}{(1 - \mu)(1 - \gamma)} \right) \cdot \text{cost}(\mathbf{s}^*) \quad (2)$$

Proof.

$$\begin{aligned} \text{cost}(\mathbf{s}^t) &\leq \sum_i c_i(\mathbf{s}^t) \\ &= \sum_i [c_i(s_i^*, s_{-i}^t) + \delta_i(\mathbf{s}^t)], \quad \delta_i(\mathbf{s}^t) = c_i(\mathbf{s}^t) - c_i(s_i^*, s_{-i}^t) \\ &\leq \lambda \cdot \text{cost}(\mathbf{s}^*) + \mu \cdot \text{cost}(\mathbf{s}^t) + \sum_i \delta_i(\mathbf{s}^t) \\ \text{cost}(\mathbf{s}^t) &\leq \frac{\lambda}{1 - \mu} \cdot \text{cost}(\mathbf{s}^*) + \frac{1}{1 - \mu} \cdot \sum_i \delta_i(\mathbf{s}^t) \end{aligned} \quad (3)$$

we shall let $\Delta(\mathbf{s}^t) = \sum_i \delta_i(\mathbf{s}^t)$ in the remaining parts of the proof. We shall now define a state \mathbf{s}^t to be bad if it does not satisfy (2) and by (3), when \mathbf{s}^t is bad we get

$$\Delta(\mathbf{s}^t) \geq \gamma(1 - \mu) \cdot \text{cost}(\mathbf{s}^t)$$

By the MaxGain definition and the inequality relating the potential function and cost,

$$\max_i \delta_i(\mathbf{s}^t) \geq \frac{\Delta(\mathbf{s}^t)}{k} \geq \frac{\gamma(1 - \mu)}{k} \cdot \text{cost}(\mathbf{s}^t) \geq \frac{\gamma(1 - \mu)}{k} \cdot \Phi(\mathbf{s}^t)$$

and we get what we desire as

$$\Phi(\mathbf{s}^t) - \Phi(s_i^*, s_{-i}^t) = c_i(\mathbf{s}^t) - c_i(s_i^*, s_{-i}^t) = \delta_i(\mathbf{s}^t)$$

and hence

$$\left(1 - \frac{\gamma(1 - \mu)}{k} \right) \Phi(\mathbf{s}^t) \geq \Phi(\mathbf{s}^{t+1}) \quad (4)$$

whenever \mathbf{s}^t is a bad state. The equation in (4) says that for every MaxGain best response dynamics, if the state is bad, the new state \mathbf{s}^{t+1} is smaller than the previous state \mathbf{s}^t by a factor of $1 - \frac{\gamma(1 - \mu)}{k}$. By Lemma 0.1, the potential decreases by a factor of e for every $\frac{k}{\gamma(1 - \mu)}$ bad states encountered. Thus solving

$$e^{-n} \Phi(\mathbf{s}^0) \geq \Phi_{\min}$$

shows (1). □
